ATHARVA NATURE HEALTHCARE · INVENTO

Invento process map

Updated 3 Nov 2026 · matches the app at commit 6880160 (migrations up to 0128)

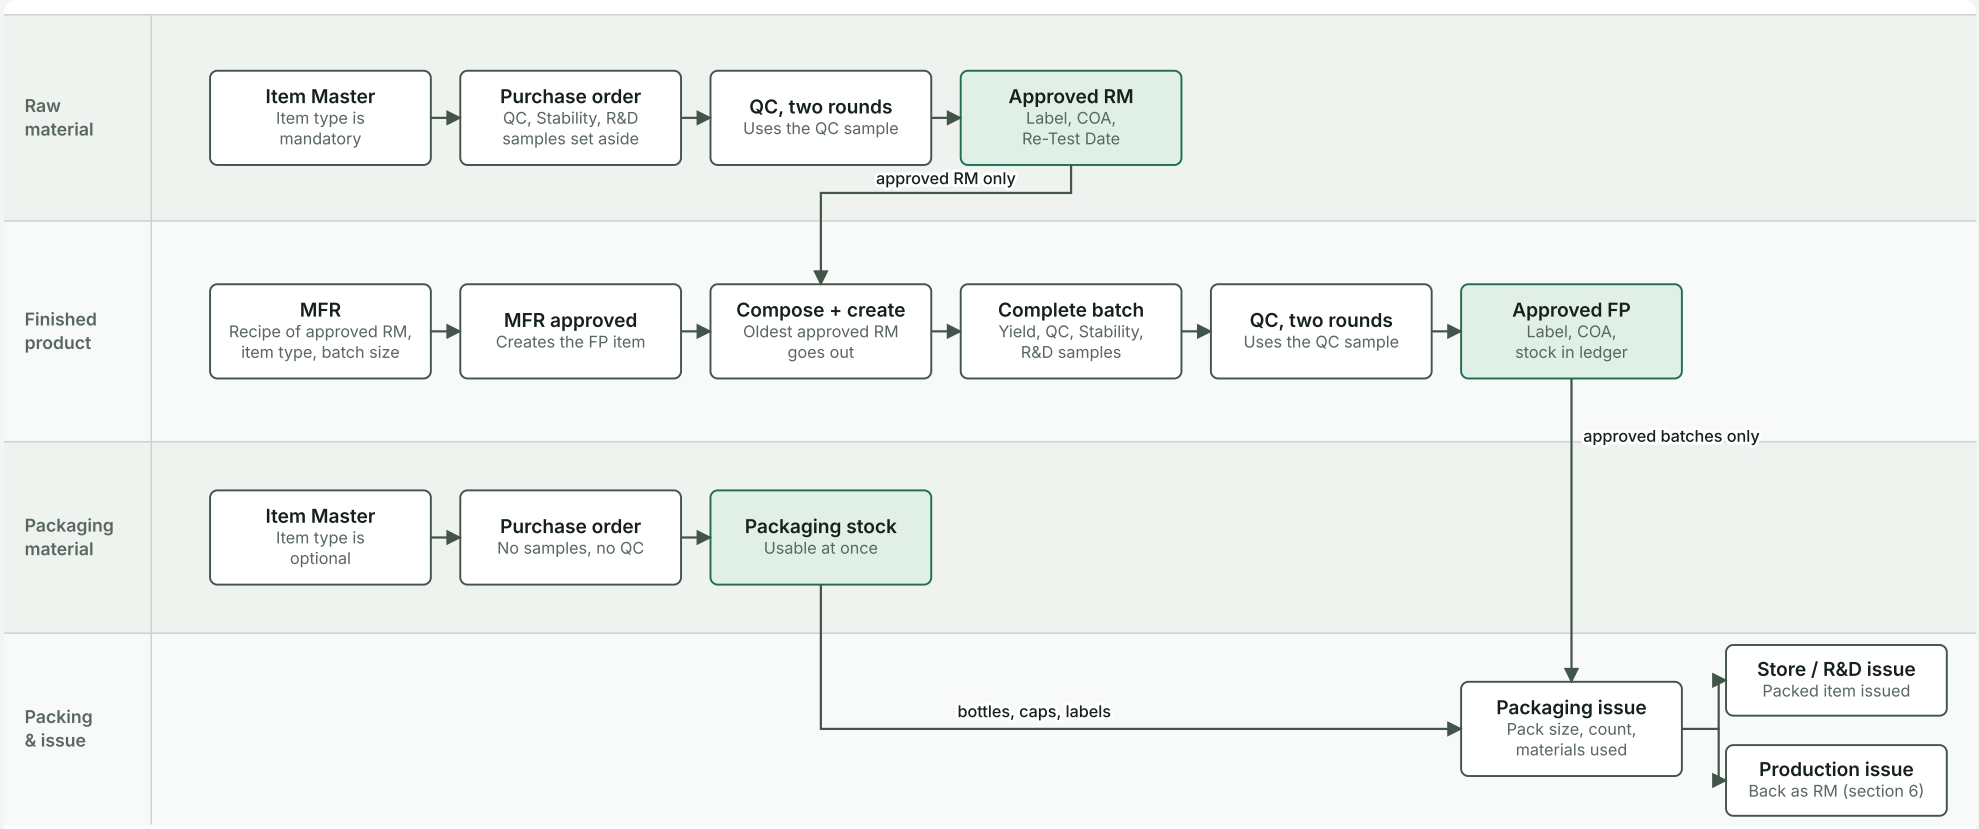

How the three kinds of item move through the app: raw material is bought, sampled and tested; packaging material is bought and used; finished product is made, tested, packed and issued. One overview, then a detailed map for each stage, opening stock, the stock views, and the questions still open before go-live.

Step · Approved / usable · Database rule · Rejected · Document, label or link · --- Loop or side link

Overview · 1 Item masters · 2 Purchasing and samples · 3 Raw material QC · 4 COA · 5 Finished product · 6 Packaging and issue · 7 Opening stock · 8 Seeing stock · Statuses · Documents · Go-live questions

The whole app on one page

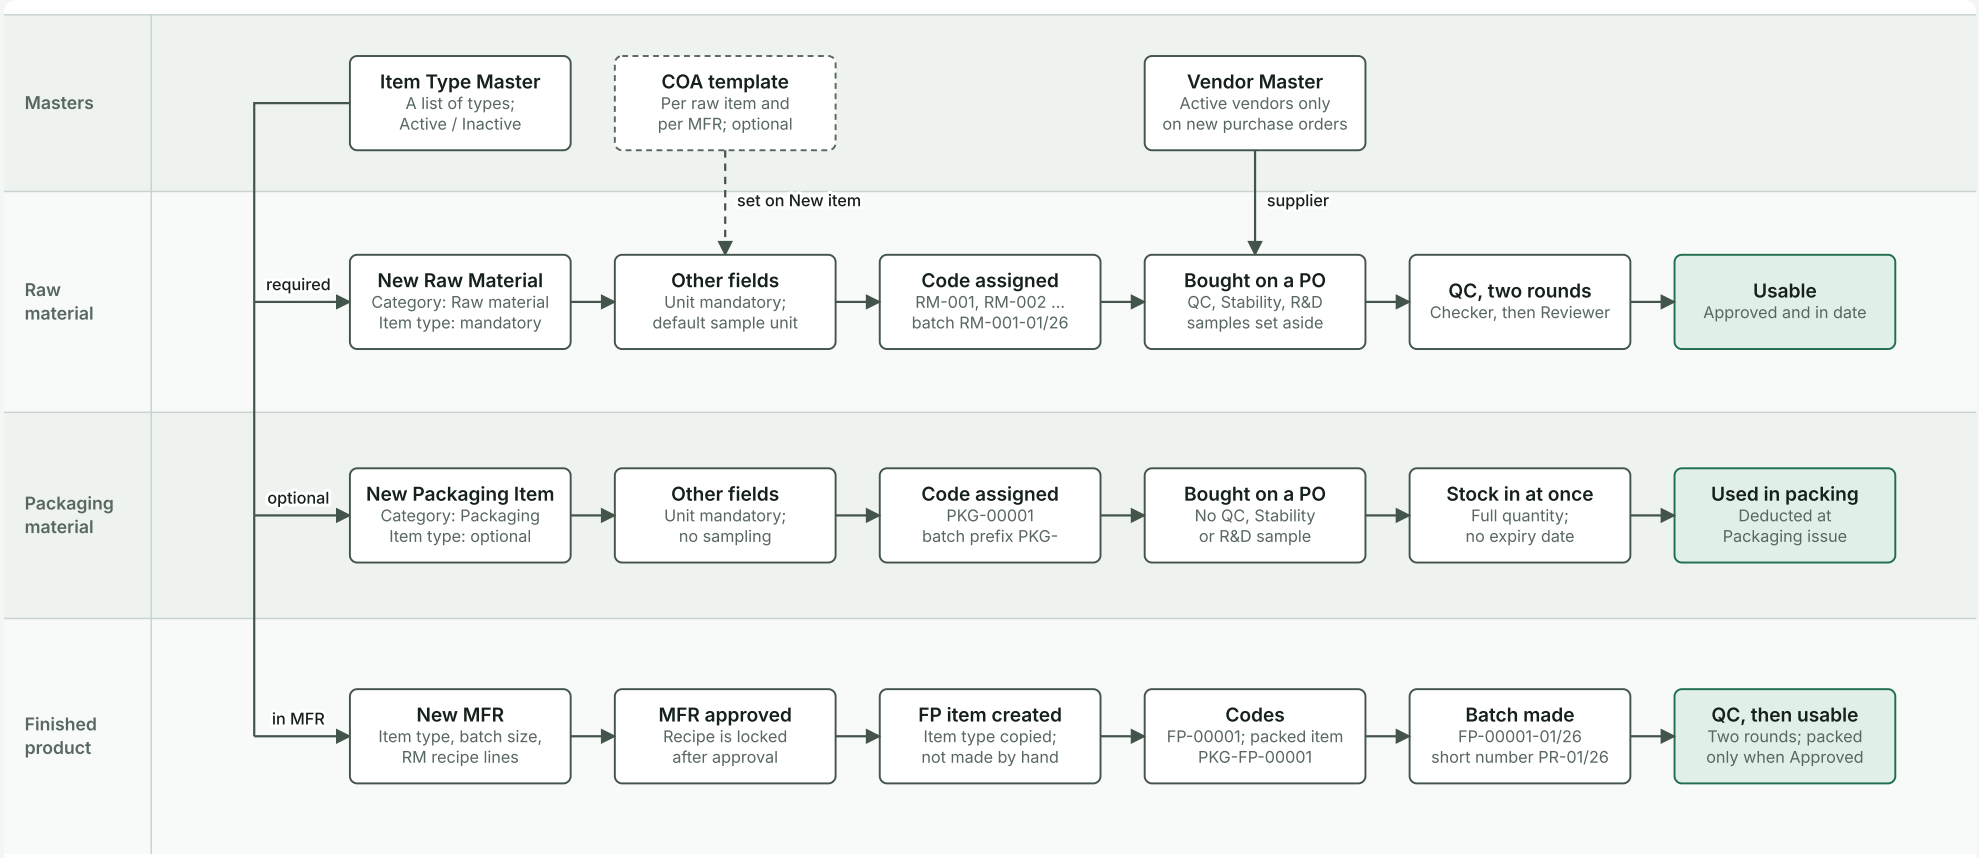

Each item category has its own lane. Approved raw material feeds production. Packaging stock feeds packing. Approved finished product is packed and then issued.

Overview. Raw material needs an item type and goes through QC; packaging material does not. Finished product is made from approved raw material only, then passes the same two-round QC before packing. Stock already on the shelves at go-live enters through Opening Stock (section 7); every stock movement is seen in the Inventory Ledger (section 8).

1. Item masters: three kinds of item

An item belongs to one of three categories. Raw material and Packaging items are added in Item Master. A Finished Product item is never added by hand: it appears when an MFR is approved.

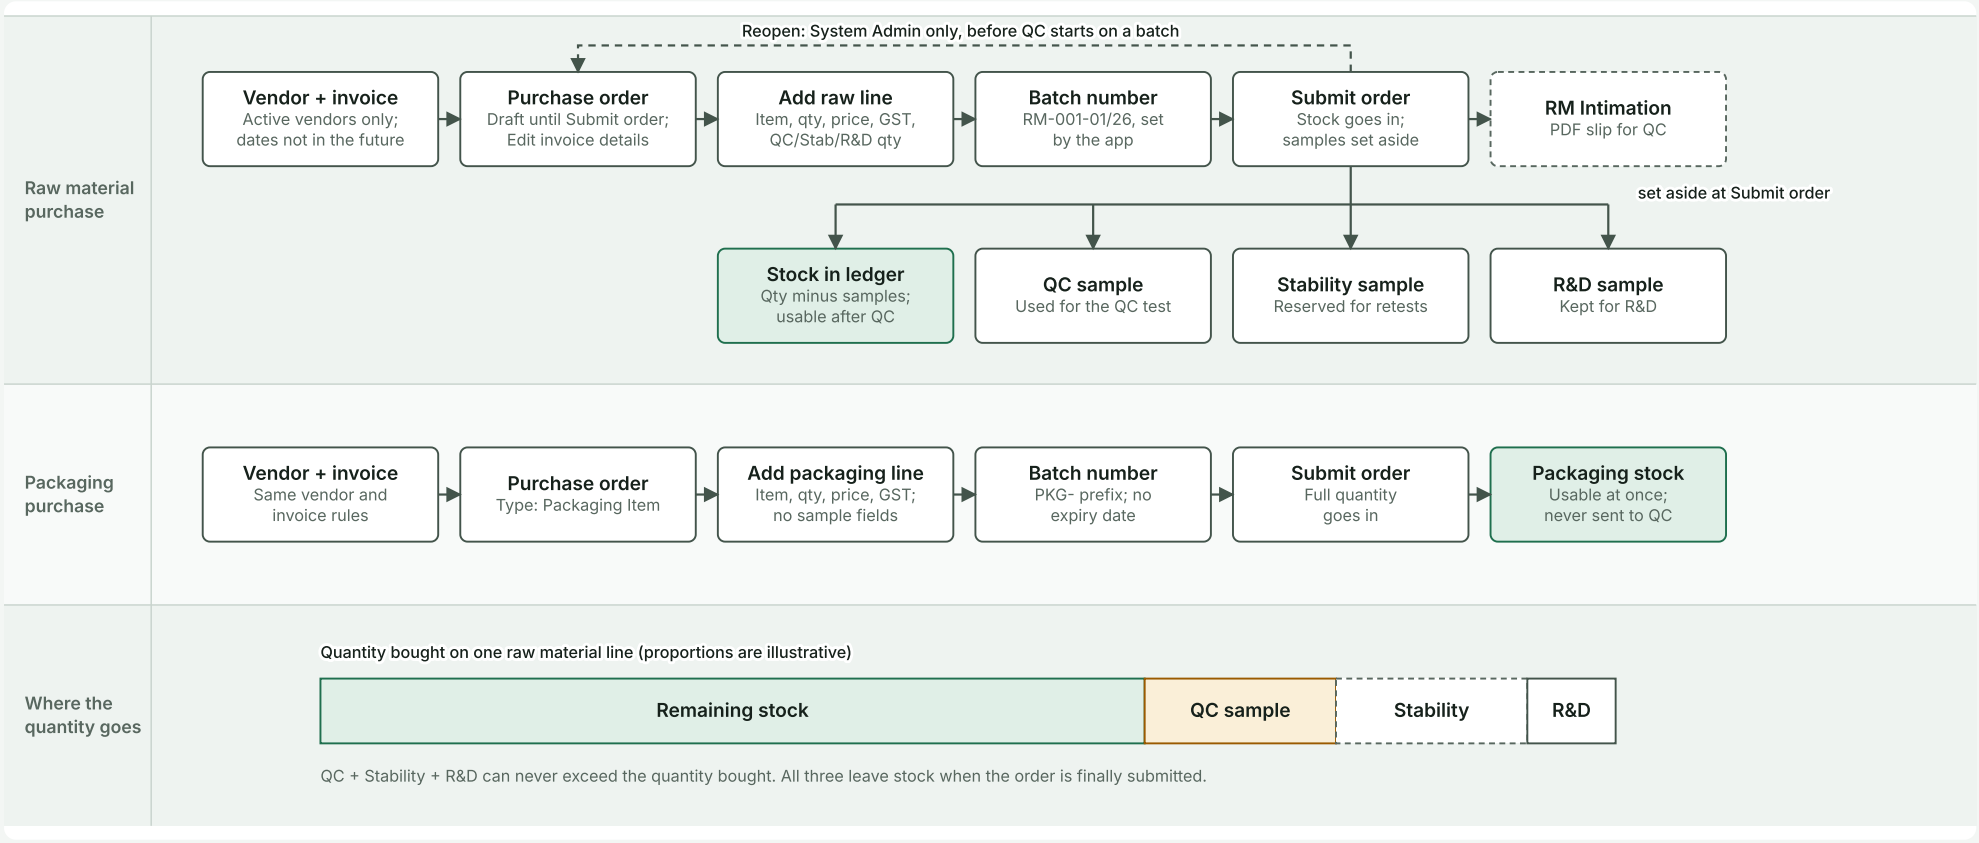

Item Type Master feeds all three lanes: required for a raw material, optional for packaging, and chosen on the MFR for a finished product. Separately, each raw item and each MFR can carry its own COA template, set when it is created.

> **Two different words, both called type.** The category (Raw material, Packaging, Finished product) decides how the item behaves. The Item Type is a separate list kept in Item Type Master. A raw material cannot be saved without one. The COA template no longer depends on it: since 3 Oct 2026 each raw item and each MFR has its own.

2. Purchasing, and the three samples taken from raw material

A purchase order stays a draft until it is submitted with Submit order. Only active vendors can be chosen. The invoice date and the Received on date cannot be in the future, and they (and, while there are no lines, the vendor) can be corrected with Edit invoice details until Submit order. Price and GST are required on every line. For a raw material line, the QC, Stability and R&D sample quantities are entered on the line and leave stock at Submit order. A packaging line has no sample fields and no QC.

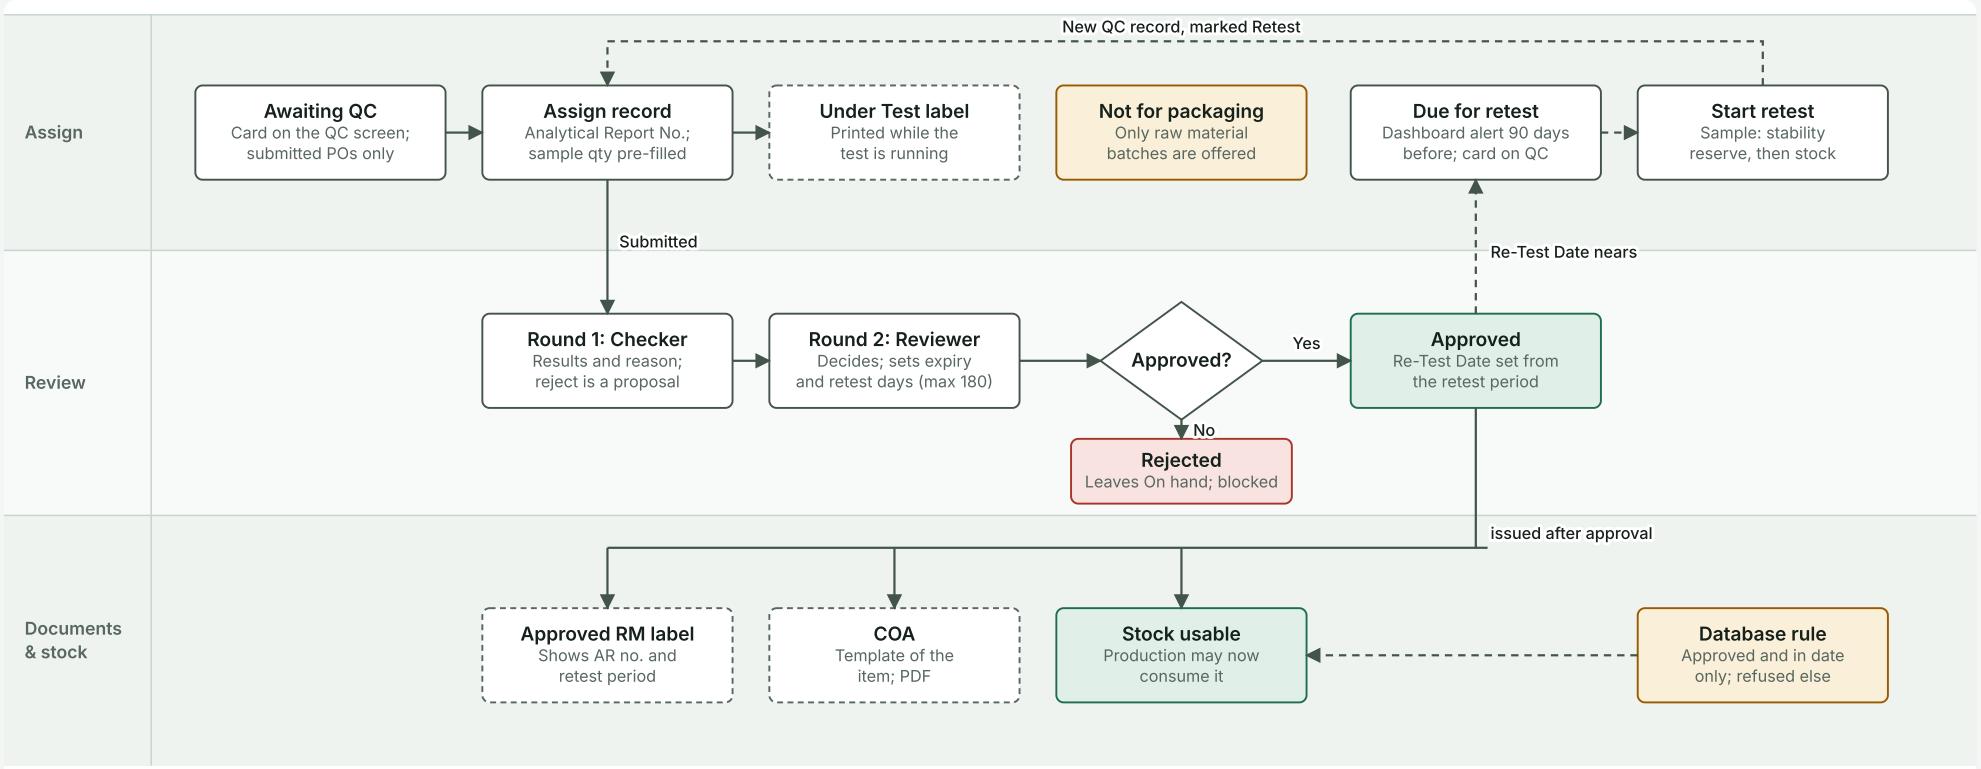

Raw material and packaging purchasing. The bar shows the quantity on one raw material line being split into usable stock and the three samples.

> **Reopening and limits.** A System Admin can reopen a submitted order, which reverses its stock, but only until QC has a record on any of its batches, and never once a batch was used, written off or rejected. Quantities, prices and text fields have sensible upper limits; a figure ten times larger than the last purchase of that item asks for a tick before it is saved.

3. Raw material QC: using the QC sample

QC is recorded against the QC sample already set aside at purchase, so saving a QC record moves no stock. Each record gets an Analytical Report No. (ARRM-0001/26 style). Two rounds, by two different people, are needed before a batch is usable. The Reviewer sets the expiry date and the number of days until retest.

Raw material QC and retest. A retest takes its sample from the Stability reserve first and any remainder from stock, then runs the same two rounds.

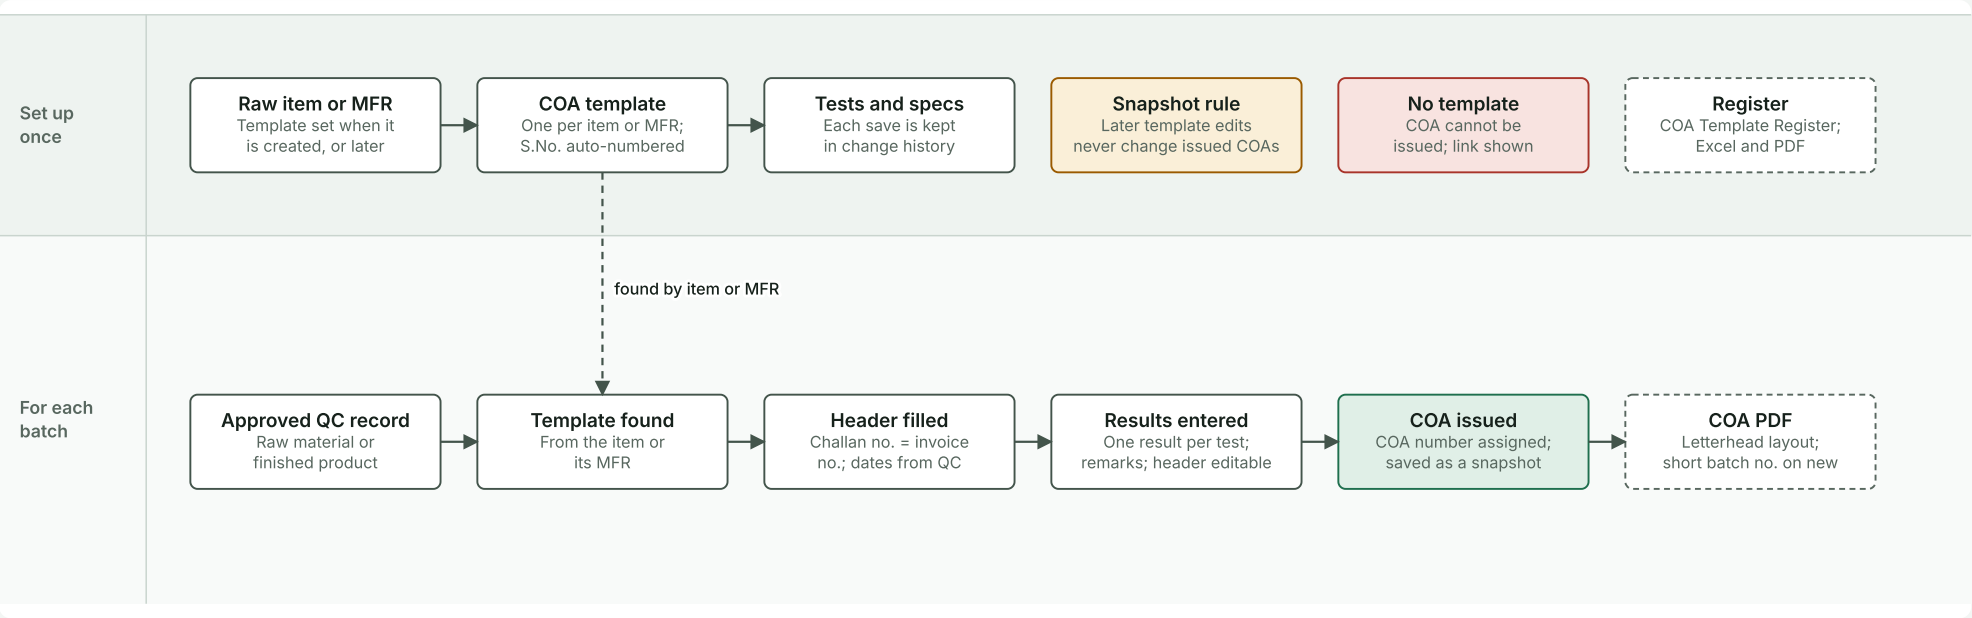

Results, reasons and rejection. Round 1 (Quality Checker) types the result of every test on the COA template and gives a written reason (at least 3 characters) for Approve or Reject. A Round 1 rejection is only a proposal: the batch stays in stock until Round 2 (QC Reviewer) confirms it or sends it back with a reason. The Reviewer may edit the results; if so, the Reviewer's results are final and go on the Certificate of Analysis, otherwise Round 1's stand. Both sets are kept, with a decision history. A rejected record can be voided by a QC Reviewer or System Admin with a reason; the stock returns. A raw material with no COA template cannot start Round 1.

> **Retest limits.** A raw material batch is retested at most three times, each retest period at most 180 days (pre-filled with 180). On the third retest the Reviewer sets only the expiry date. A batch past its expiry date is never retested. Rejected raw material leaves On hand at once and shows under Rejected Materials. If two people decide the same record together, the first decision is saved and the second is told to refresh.

4. Certificate of Analysis

A COA is generated for an approved QC record, raw material or finished product, from the template of that raw item or MFR. Results are entered per test and the certificate is saved as a snapshot.

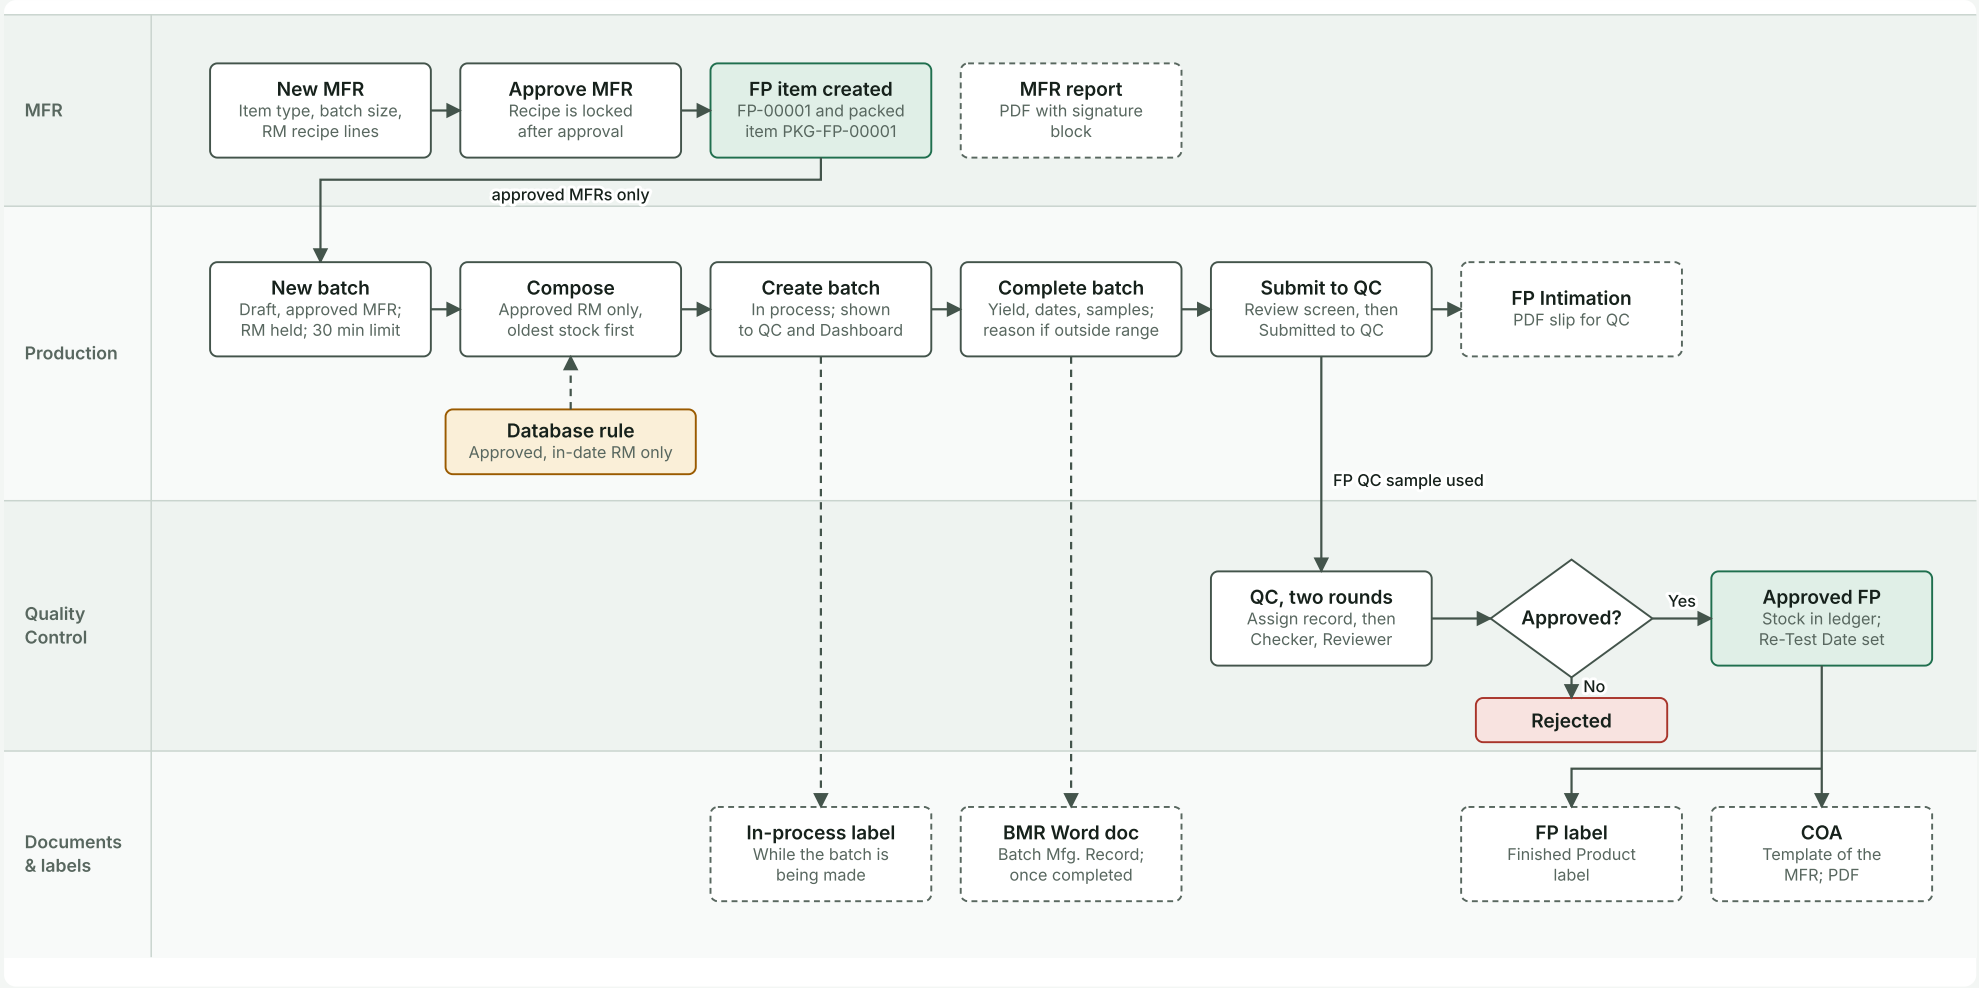

Who edits a template follows the item or MFR: for a raw material, System Admin, Inventory Manager and MFR Manager; for an MFR, System Admin and MFR Manager. QC roles issue certificates but no longer edit templates.

COA generation. Each raw item and each MFR has its own template, optional when created; a COA is blocked until one exists. Certificates already issued keep the wording they had when issued.

5. Finished product: recipe, batch, QC

The MFR is approved once and creates the finished-product item. Each batch is composed automatically from approved raw material, oldest stock first (nobody picks batches), and the raw material is held as soon as the Draft is saved. A Draft that is not started within 30 minutes cancels itself and releases the stock. The batch is then completed and cleared by the same two-round QC using the finished-product QC sample.

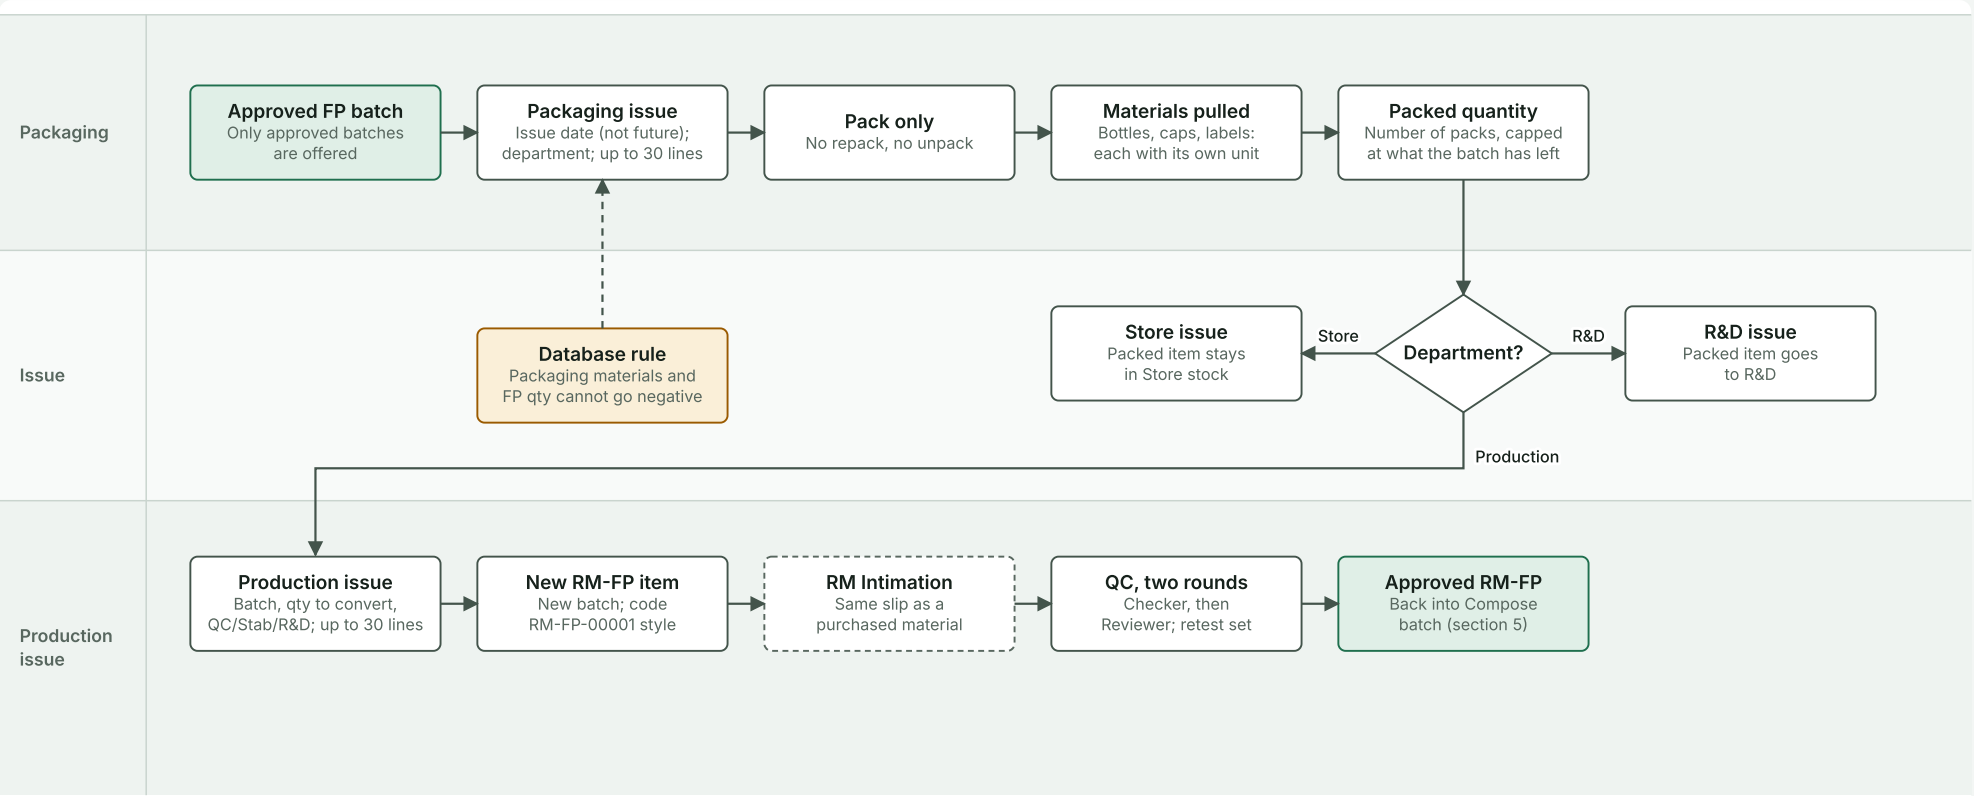

Finished product production. The Batch Manufacturing Record (BMR) Word document is available from the batch screen once the batch is completed; it is generated on demand, not stored.

Completing a batch. The yield is shown as a percentage of the batch size and the range the MFR allows; outside that range a reason is required, and above 150% it is refused as a likely typing mistake. A review step comes before saving, because a completed batch cannot be corrected on screen. Batch numbers come in two forms: the full FP-00001-01/26 and a short PR-01/26 (Domestic) or OR-01/26 (Export) that printed documents and Reports use. A completed batch page shows samples taken, bulk used by packaging, bulk left and each packing run.

Retest of a finished batch. A finished product batch follows the same cycle as raw material: when its retest date arrives it appears on the QC page under Finished product due for retest, and Start retest takes the sample from the stability sample first, then from the bulk. At most three retests, each at most 180 days; the third takes only an expiry date; a retest never extends the expiry and its date can never fall after it. While a retest is open, or once the batch is expired or past its retest date, packing and finished product labels are refused. A rejected retest takes the bulk out of On hand (packs stay); voiding it brings the bulk back. The batch page lists First QC and each retest.

6. Packaging and issue, and product returning as raw material

Only approved batches can be packed. Every issue is a pack: there is no repack or unpack. One save can hold up to 30 lines (different pack sizes or batches), each with its own packaging materials and its own PKG- code, and it is all saved or none. The packed product is issued to Store, R&D, or Production, where a Production issue becomes a new raw material. An issue made by mistake is voided, not edited (see the box below the diagram).

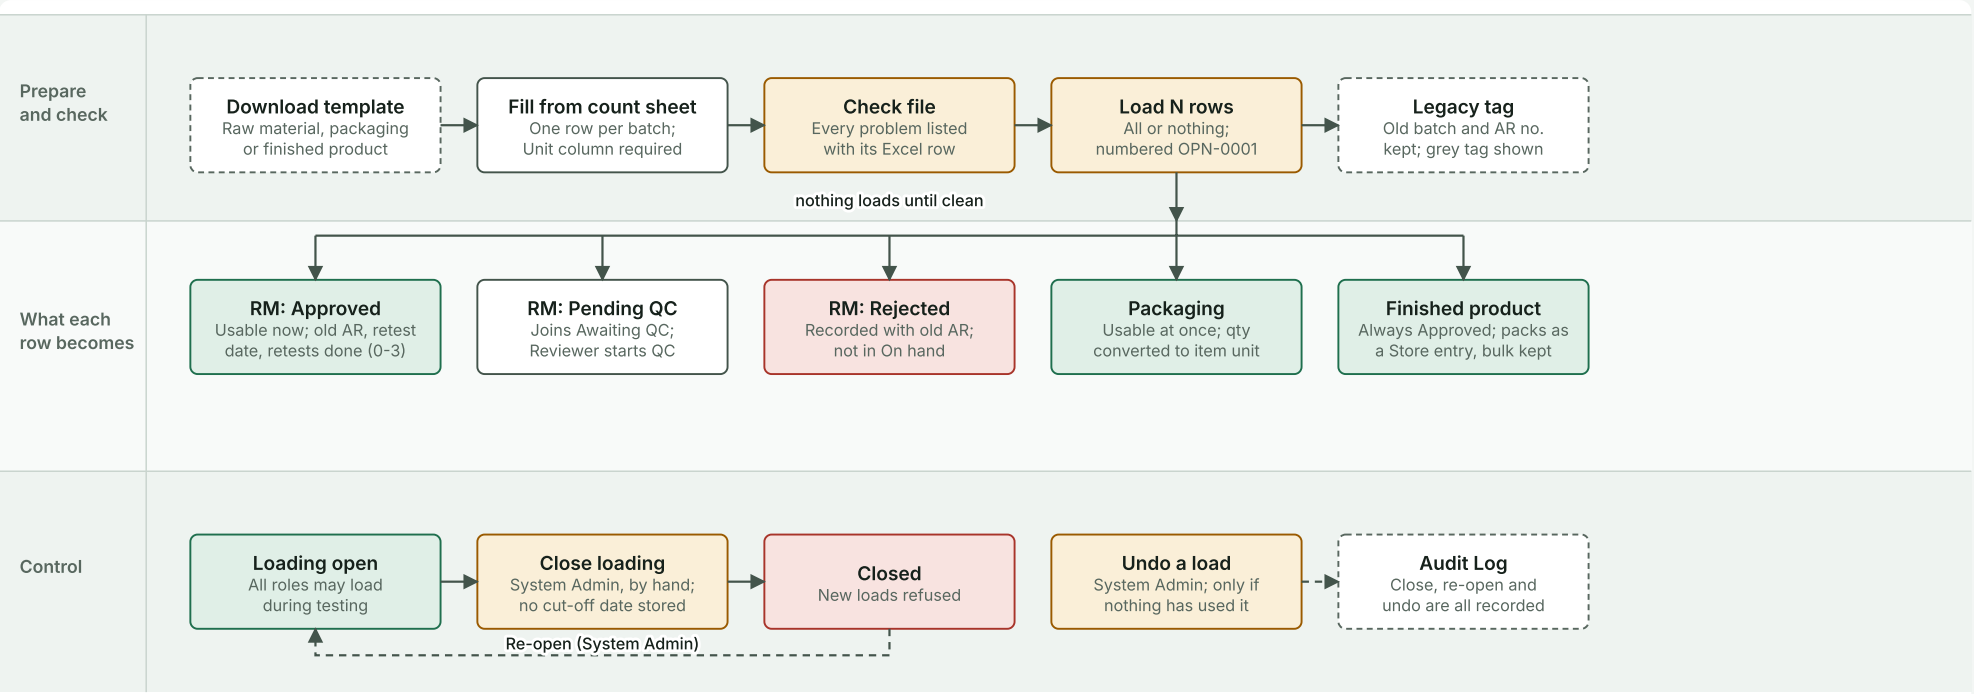

Packaging, department issue and the Production issue loop. The new RM-FP batch cannot be consumed until it is QC-approved. A shortage shows as a red “Not enough stock for …” message under the line and Save stays greyed out until it is fixed.

> **Voiding a packaging issue.** An Inventory Manager or System Admin clicks Void in the issue's Status column on the Packaging list, reads the red box listing what goes back, gives a reason (at least 3 characters) and confirms. Nothing is deleted: new opposite ledger rows put the bulk back on its finished product batch, each packaging material back on the batches it came from, and take the packs off Packaged Finished Product stock. The issue stays on the list struck through with a Void badge, the date, who voided it and why. A Production issue can be voided only while its RM-FP batch has not been used in a finished product batch or written off; that RM-FP batch then leaves stock and its QC record is marked Void ("Voided with its packaging issue" in the decision history).

7. Opening stock: loading what is already on the shelves

Before go-live the physical stock count is loaded at Admin → Opening Stock, either from an Excel sheet or by typing the rows in on the page; both go through the same checks. Raw material, packaging and finished product (packed and bulk) each have their own template and their own typed-in form. Loaded batches are tagged Legacy wherever they appear, and old batch and AR numbers are kept as typed.

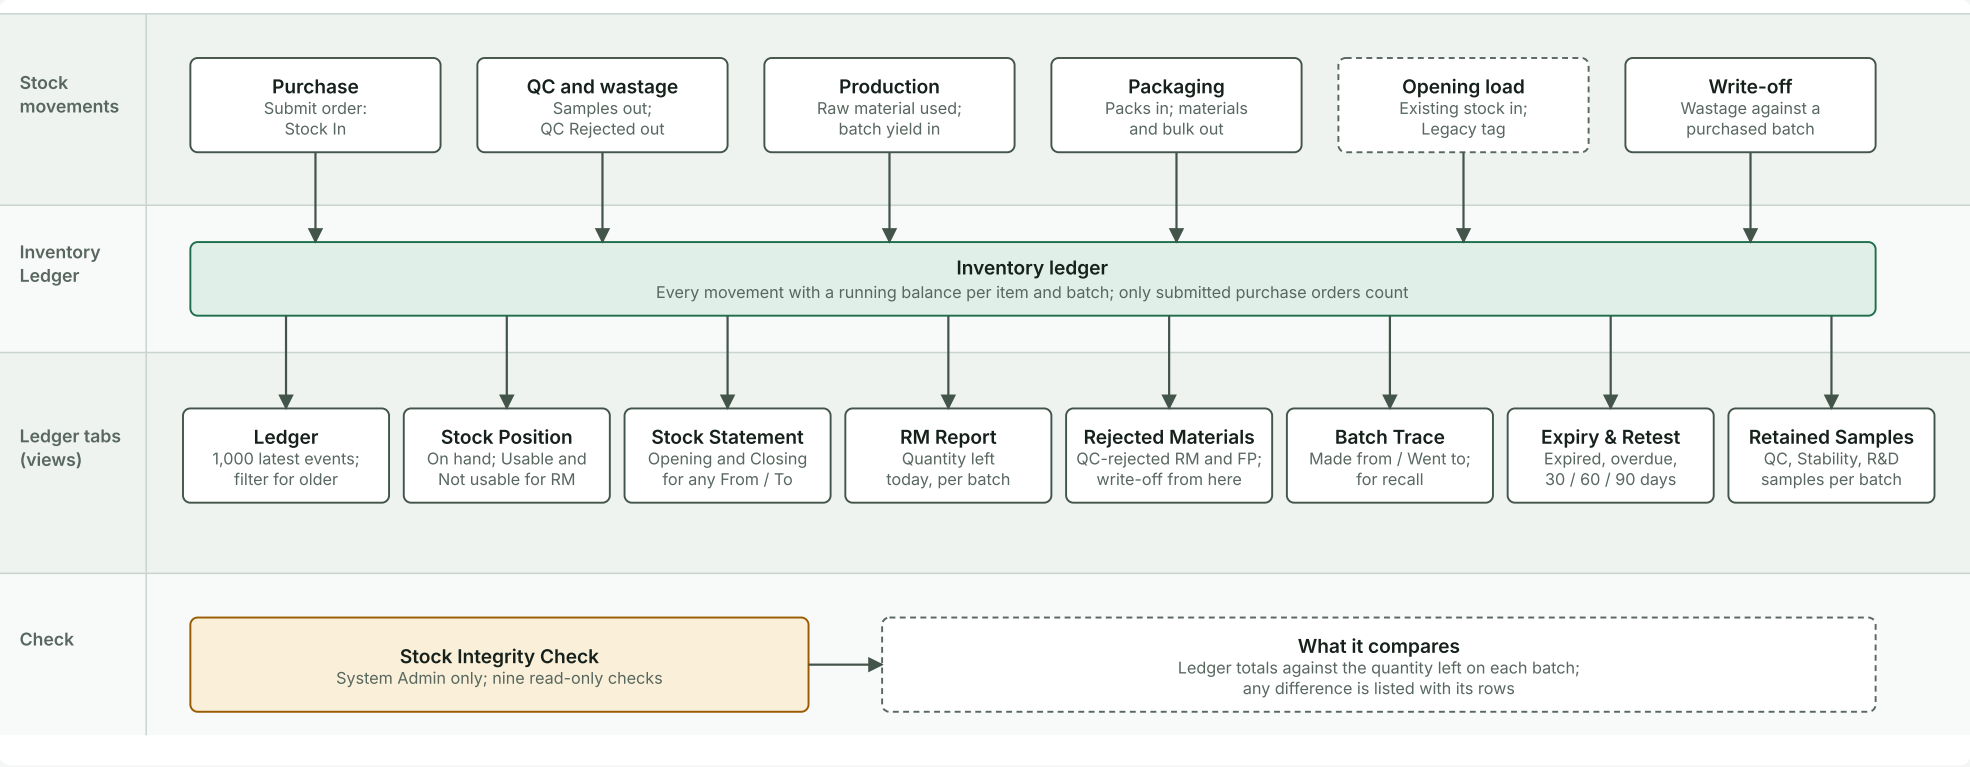

Opening stock. Check file lists every problem with its Excel row and loads nothing until the file is clean; a load is all or nothing. Raw material rows are Approved, Pending QC or Rejected one by one. Loading stays open during testing and a System Admin closes it by hand; the app stores no cut-off date.

> **Units and numbers.** Raw material and packaging rows carry a Unit column; if it differs from the item's own unit but is the same kind (g for kg) the quantity is converted, otherwise the row is refused. Batch numbers and AR numbers that look like ones the app makes (ITEM-0001/26, ARRM-0001/26, ARFP-0001/26) are refused so an old number can never be mistaken for a new one.

8. Seeing stock: the Inventory Ledger tabs and the integrity check

Every stock event writes one row to the inventory ledger. Eight tabs on the Inventory Ledger page read it in different ways, and a System Admin check proves the ledger and

the batches still agree.

One ledger, eight views. For raw material, On hand splits into Usable (approved, in date) and Not usable (awaiting QC, retest due, expired). Rejected raw material is not counted in On hand. The Stock Integrity Check changes nothing; if it fails, note the rows and tell the developer rather than correcting stock by hand.

Statuses a record moves through

Purchase order
one per vendor invoice

`Draft` → `Submitted` → Reopen (System Admin, before QC starts) returns it to Draft

QC record
raw material or finished product

`Awaiting QC` → `Round 1 approved — awaiting review` → `Approved` or `Rejected`

QC record, rejection path
Round 1 only proposes

`Awaiting QC` → `Round 1 rejection proposed` → `Rejected`
or sent back to Awaiting QC; a Rejected record can be voided with a reason and returns to Awaiting QC

QC record of an RM-FP batch
from a Production packaging issue

`Any status` → `Void` when its Production packaging issue is voided; a Void record cannot be decided

Packaging issue
one per PKG- code

`Issued` → `Void` Inventory Manager or System Admin, with a reason; the stock goes back

Finished product batch
one per manufacturing run

`Draft` → `In process` → `Complete — Awaiting QC` → `Submitted to QC` → `Approved` or `Rejected`
A Draft cancels itself after 30 minutes

Raw material batch in stock
what production may use

`Awaiting QC` → `Usable` → `Retest due` → `Usable again` or `Expired` / `Rejected`

Vendor
shown under Show inactive

`Active` ⇄ `Inactive` Inactive vendors cannot be chosen on a new purchase order

Opening stock loading
System Admin controls it

`Open` → `Closed` Re-open, or undo a load that nothing has used

Documents and labels: when each one appears

DOCUMENT	PRODUCED WHEN	FORMAT

RM Intimation slip	A raw material purchase order is finally submitted, or a Production issue creates a new RM-FP batch.	PDF
Under Test label	A raw material batch is awaiting or going through QC.	PDF label
Approved Raw Material label	A raw material batch has passed both QC rounds. Shows Date of Receipt from the Received on date of its purchase.	PDF label
In-process label	A finished product batch is being made.	PDF label
BMR (Batch Manufacturing Record)	A finished product batch has been completed. Available from the batch screen.	Word
FP Intimation slip	A finished product batch is submitted to QC.	PDF
Finished Product label	A finished product batch is approved, in date, not past its retest date and not being retested.	PDF label
COA	Any approved QC record, raw material or finished product, using the template of its raw item or MFR.	PDF
Packing Register	Any time from the Packaging list.	PDF
Opening stock template	Admin → Opening Stock, one per kind (raw material, packaging, finished product).	Excel
Ledger and report exports	Inventory Ledger tabs, Reports and most lists, as printed or filed.	Excel and PDF
MFR report	Any time from the MFR screen.	PDF

Rules the database enforces

Approved and in date only

No screen or direct call can consume a raw material batch that is not QC-approved or whose retest date has passed. Packing and labelling a finished product batch is refused when it is expired, past its retest date or being retested.

No negative stock

Wastage, samples, composition and packaging are refused when the batch or item does not have the quantity.

Oldest stock first

A finished-product batch must use the oldest approved batch of an ingredient before a newer one.

Every change is logged

All business tables write to the Audit Log, and at least one System Admin must always remain. Sign-ins, sign-outs, failed sign-in attempts and password changes are logged too.

Sensible limits

Quantities, prices and text lengths above fixed limits are refused, on screen and in the database, with a message that names the field.

No dates in the future

Invoice, received, batch start, finish and packing issue dates cannot be later than today; an expiry date cannot be in the past.

Someone else changed this

If a record was changed by another person after you opened it, your save is refused and you are asked to refresh, so nobody overwrites a colleague unknowingly.

One person, one QC round

The database records who made each round, so the same person cannot approve both rounds on one record by any route (System Admin is the only exception), and a decided record is final. A QC record cannot be created already decided: every new one starts at Awaiting QC.

Voids put stock back, never delete

Voiding a packaging issue writes opposite ledger rows, so every movement and its reversal stay in the ledger. A Production issue whose RM-FP batch was already used or written off cannot be voided.

Retest and expiry limits

Raw material and finished product: at most three retests, each at most 180 days; a retest never extends the expiry and its date can never fall after it; an expired batch is never retested and never used.

Running alongside every step

Inventory Ledger	Every stock event (receipt, sample, consumption, wastage, issue, opening load) with a running balance per item and batch, in eight tabs including Stock Statement, Rejected Materials and Batch Trace.
Dashboard	Low stock, retest due within 90 days (raw material and finished product), finished-product expiry within 90 days, and finished product batches in progress.
Reports	RM Stock, QC Register, FP Register and Purchase Register, each with PDF and Excel export.
Audit Log	Who changed what and when, plus sign-ins and failed attempts. Read by System Admin and Super Auditor.
Stock Integrity Check	System Admin screen that compares the ledger with the batches (section 8).
User Guide	Overview → User Guide holds the guide and this process map, both as PDF.
Access	Six fixed roles (System Admin, Inventory Manager, MFR Manager, QC Checker, QC Reviewer, Super Auditor), enforced in the database.

Open questions before go-live

These need an answer from Atharva before real data goes in. Each one says what the app does today, so the decision is clear; some are marked answered or done. The last column points to the open items list or the full-app scan.

Who can do what: the six roles today

ROLE	CAN ADD OR CHANGE
System Admin	Everything, plus user roles, deleting master data, reopening a submitted purchase order, closing and undoing opening stock loads, the Stock Integrity Check and the Audit Log.
Inventory Manager	Item types, items, vendors, purchase orders, QC assign, wastage, finished product batches, packaging issue, equipment, dead stock.
MFR Manager	Item types, items, MFR, finished product batches, packaging issue, equipment, dead stock.
QC Checker	QC assign, Round 1 review, wastage, COA, documents, equipment, dead stock.
QC Reviewer	QC assign, Round 2 review (sets retest days), wastage, COA, documents, equipment, dead stock.
Super Auditor	Read-only across the app, plus the Audit Log.

A. Opening stock and data to load

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST

GL-1	Raw material opening stock: who prepares the count sheet, and which batches go in as Approved, Pending QC or Rejected?	Built 4 Oct 2026. Admin → Opening Stock loads an Excel count sheet; each row is Approved, Pending QC (joins the normal QC queue) or Rejected. A load is all or nothing and is numbered OPN-0001.	B4 (done)
GL-2	For approved opening batches, do you have per batch the old batch number, quantity, old AR number, QC approval date, Re-Test Date and expiry date?	Those are the columns. Old batch and AR numbers are kept as typed and shown with a grey Legacy tag. Retests already done (0 to 3) count toward the limit of 3.	B4 (done)
GL-3	Finished product opening stock: packed and bulk quantities by batch?	Built: one row per batch with bulk unpacked, packs in stock and pack size. Always loaded as Approved; packs appear as a Store packaging entry.	B4, B30
GL-4	Packaging opening stock: is a count sheet per item acceptable, and is a price needed?	Built. A Unit column is required and converted to the item's unit. Vendor and price are optional.	B4 (done)
GL-5	What is the cut-over date, and is the old system stopped that day or run in parallel for a while?	Not decided. Loading stays open during testing and a System Admin closes it by hand after the agreed date; the app keeps no cut-off date. The legacy sample in the app is small (18 of 248 MFRs, 7 batches).	B30
GL-6	Which masters must be loaded before go-live, and who prepares and checks them: Item Types, Items, Vendors, MFRs?	Excel upload exists for Item Types, Items, Vendors, MFRs, Purchase, Equipment and Dead Stock.	B30
GL-7	What happens to the test data? Keep masters, remove all transactions?	Admin → Purge Test Data exists. All current data is test data. A backup should be taken first (GL-27).	B10, B40

B. Roles and access

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST
GL-8	Which named people at Atharva take which of the six roles? Can one person hold several?	Roles are assigned by a System Admin. A person may hold more than one role.	B14
GL-9	Who is the Production In-charge? Should purchase be limited to that person, with QC limited to reports and AR numbers?	System Admin and Inventory Manager can purchase. No narrower role exists.	B22
GL-10	Should some roles not see vendor prices or formulae?	Every signed-in user can read everything.	B1
GL-11	Are Round 1 (QC Checker) and Round 2 (QC Reviewer) always different people? Who is the Super Auditor?	Round 1 needs the Checker role and Round 2 the Reviewer role, and one person cannot do both rounds on a record (System Admin excepted). The Super Auditor is read-only plus the Audit Log.	B14
GL-12	How are users created, and what login rules do you want: multi-factor sign-in for admins, password expiry?	Sign-up is off; an admin creates users. Passwords need 10 characters; there is no expiry or multi-factor sign-in. Sign-ins, failed attempts and password changes are logged.	B3, B19

C. QC, in-process testing and stock rules

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST
GL-13	What is In-Process QC at Atharva? Which tests, at which stage, by whom?	Nothing records in-process tests. A batch has an In process status and an In-process label.	B17

GL-14	Should QC be told when a batch starts so they can test during production? In the app only, or by email or WhatsApp?	Answered for the app on 10 Oct 2026: a Finished Product Batches In Progress card on the QC page and Dashboard. Email or WhatsApp needs an outside service and a cost decision.	B34 (done)
GL-15	Do in-process results need a record with limits and sign-off, a report template, and a hold on completing the batch?	Not built. The old design had In Process, Under Test and Approved/Rejected states; the app has two review rounds.	B17
GL-16	What should happen to a rejected batch: return to vendor, destroy, rework?	Rejected raw material leaves On hand at once and shows under Rejected Materials; wastage can write off a rejected purchased batch. There is no return, destruction or rework record, and finished product or in-house batches cannot be written off yet.	Scan P3-07
GL-17	Is the retest period decided per batch by the Reviewer, or should each item have a default? Is a 90-day warning right?	The Reviewer sets days per batch, pre-filled with 180 (the maximum). At most 3 retests per batch, for raw material and finished product alike. The Dashboard warns 90 days ahead; a batch past its Re-Test Date or expiry cannot be used.	new
GL-18	Is Oldest stock first a rule with no exceptions, or can a newer batch be used for a reason?	Automatic and a hard rule in the database: the app takes the oldest approved batches and splits across them. Users cannot choose a batch.	new

D. Documents, labels and masters

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST

GL-19	COA templates: one per Item Type, or one per item?	Answered 3 Oct 2026: one per raw item and per MFR, optional at creation, COA blocked until set, edited by whoever edits the item or MFR (QC cannot), tracked in the COA Template Register with history and Excel/PDF. Open: no copy-from-another-template yet; bulk upload fills many at once.	FB-0053 (done)
GL-20	Should COA data fields be locked with only remarks editable? Is a COA file upload needed?	Built: the header and tests are rebuilt from the batch and the template and are locked; only results (taken from QC), remarks and Sampled Qty come from the form. Older COAs hold a file link only; no file upload.	B2, B17
GL-21	Printed header: licence number with a slash or a dash, and where do the logo and company name sit? On which documents?	Printed as PD/AYU-111, with the company name to the right of the logo.	B32
GL-22	Labels: one label per print, or a sheet of six, for which label types?	A sheet of six, as asked on 19 Sept.	B33
GL-23	BMR and MFR print: Word or PDF? Purchase intimation: Word or Excel too?	BMR is Word, MFR is PDF, the intimation slips are PDF.	C2, B9
GL-24	Control sample for packaging, and wastage or labels for raw material made by Production issue?	Samples exist only on raw material lines. Wastage and labels work only for purchased batches.	B21, B24, B25
GL-25	AR number format and units: keep as is? Are units like 0.1 kg missing for your packs?	AR numbers are ARRM-0001/26 for raw material and ARFP-0001/26 for finished product; the format has not been confirmed. Pack size is free text as a workaround.	B18, B29

E. Go-live, hosting and scope

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST
GL-26	What is the go-live date, and who signs off user testing?	Plan saved for a separate test environment. Real data is expected in 1 to 3 months.	B40
GL-27	Backups: what policy is required before real data (daily, how long kept, who restores)? Free or Pro hosting?	Nothing is scheduled. Pro adds daily backups for 7 days. Recommended first before real data.	B10, B11
GL-28	Should the app be reachable only from the campus network?	Reachable from anywhere with a login.	B12
GL-29	Who trains each role, and who handles issues after go-live?	Not planned. The User Guide and this process map are in the app under Overview → User Guide.	new
GL-30	Confirm out of scope for go-live: Sales and Customer, Payroll and Staff information, vendor credit and debit balance, barcode scanning, SOP/STP workflow.	None of these is built.	B5 to B8, B13

F. Corrections and quality records

#	QUESTION TO SETTLE	WHAT THE APP DOES TODAY	MASTER LIST
GL-31	A packaging issue or a finished product batch was entered wrongly: who may void it, with what reason, and does the stock come back?	Packaging issue: built 1 Nov 2026. An Inventory Manager or System Admin voids it with a reason and the stock comes back (section 6). Finished product batch: still no void or correction; a completed batch cannot be changed on screen, and a batch that failed cannot be closed.	Scan P5-04, P6-01

GL-32	An issued COA turns out wrong: who may void and replace it?	It cannot be voided or replaced, and a second COA can be issued for the same QC record.	Scan P4-09
GL-33	Stock needs correcting after a miscount, or finished product, packed product or in-house raw material must be written off: who may do it, with what reason?	Write-off works only for purchased batches, and there is no stock adjustment.	Scan P3-07
GL-34	Instruments: should calibration status be worked out from the dates and block use when overdue?	The status is typed separately from the dates and nothing marks an instrument as overdue.	Scan P8-01
GL-35	Quality events (deviations, out-of-specification results, change control, CAPA, complaints) and a signed batch record: needed in the app or kept on paper?	No place for them. Batch release rests on QC approval alone.	Scan P9-01, P9-03

Drawn from the app on main (3 Nov 2026, commit 6880160, database migrations up to 0128) and its module documents. Line Clearance, Environmental Control and the older database-backed Batch Mfg. Record module are deprecated and not shown. Examples of codes and batch numbers show the format only.
